Chan, Christina

Subject:

Rush search request for 09/674237

Please search in commercial database, issued patent files, and PGPUB:

1) A nucleotide sequence encoding SEQ ID NO:3, with size limitation of the sequences in the database 100 nucleotides or less.

2) SEQ ID NO:1, with size limitation of the sequences in the database 100 nucleotides or less. 3) SEQ ID NO:2, with size limitation of the sequences in the database 100 nucleotides or less.

Thank you. MINH TAM DAVIS

Oligonucleotide array, useful for measuring ortholog gene-expression distribution, comprising number of oligonucleotides derived from ortholog gene of different organism immobilized on support.

Disclosure; Page 16; 56pp; Japanese.

The invention relates to a novel oligonucleotide array comprising a number of oligonucleotides derived from an orthologue gene of a different organism or species immobilised on a support body. The oligonucleotide array has two sides comprising a gene derived from two different organisms, in which one side comprises a human gene. In the oligonucleotide array a base sequence differs in a different position on the support body. Each of the oligonucleotides is a partial sequence of the orthologue gene of the organism A and organism B. The sequence match degree of the organism species A and the organism species B is less than 70%. The sequence homology of the genes other than the orthologue gene of

```
the organism species A and the organism species B is the level-of-
statistical-significance value, calculated using the homology searching
algorithm: basic local alignment search tool (BLAST) and the value is 0.1

or more. The found value or the calculated value of the melting-
temperature of the variant genes other than the orthologue gene of the

organism species A and the organism species B is 20 degrees C or more.

The oligonucleotide array is useful for measuring expression distribution
of the orthologue gene in different organisms. The method is useful for
comparing expression change of the orthologue gene with respect to

comparing expression and for comparing change of the function of
the orthologue gene in different organisms. The oligonucleotide array has
the ability to perform a measurement of gene-expression distribution of
two or more types of organism simultaneously. The oligonucleotide array
improves reliability of measurement. This polynucleotide sequence
represents a probe of a rat gene for comparison against a human gene used
in the oligonucleotide array of the invention.
                                                                                                                                                                                                                                                                                                                                                                                       9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New oligonucleotide libraries comprising oligonucleotides which selectively hybridize to mRNAs transcribed from a transcription unit of genome, useful for detecting tissue-, pathology-, and developmental-

                                                                                                                                                                                                                                                                                                                                                                                               à
```

The present invention describes oligomucleotide libraries for detecting messenger RNAs that populate a (sub-)transcriptome, where the (sub-)transcriptome comprises messenger RNAs transcribed from multiple transcription units that populate a genome. The library comprises several

```
coligonucleotides, each capable of hybridising selectively to a set of
messenger RNAs transcribed from a given transcription unit of the genome,
which encodes one or more messenger RNA splice variants. The
oligonucleotide libraries are useful for detecting mRNAs from a
biological sample, in expression profilling studies, in qualitatively or
cuantitatively characterising the corresponding transcriptome, and in
cetecting RNA transcripts and splice variants of human or animal
transcriptomes. The libraries may also be used as specialised mini
libraries to detect transcripts of a sub-transcriptome under a particular
constitution of the libraries may also be used as specialised mini
libraries to detect transcripts of a sub-transcriptome under a particular
constitution appropriate state, and so allowing the detection of tissue
and pathology-specific genes such as those genes only expressed in
specific tissue under a specific pathological condition; to detect
constitution a production genes such as those genes only expressed in
specific apens; and to detect RNA transcriptom
constitution of a transcriptome of a patient suffering from a particular
character and mice, which are used in the exemplification of the
pareent invention. NB. The sequence data for this patent did not form
constitute the printed specification, but was obtained in electronic format
directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 4117
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New oligonuclectide libraries comprising oligonuclectides which selectively hybridize to mRNAs transcribed from a transcription unit of a genome, useful for detecting tissue-, pathology-, and developmental-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         9

CC messenger RNAs that populate a (sub-)transcriptome, where the (sub-)transcriptome comprises messenger RNAs transcribed from multiple cranscription units that populate a genome. The library comprises several oligonucleotides, each capable of hybridising selectively to a set of messenger RNAs transcribed from a given transcription unit of the genome, which encodes one or more messenger RNA splice variants. The coligonucleotide libraries are useful for detecting mRNAs from a biological sample, in expression profiling studies, in qualitatively or carriettively characterialism the corresponding transcriptom, and in detecting RNA transcripts and splice variants of human or animal conscriptomes. The libraries may also be used as specialised minical libraries to detect transcripts of a sub-transcriptome under a particular collibraries to detect transcripts of a sub-transcriptome under a particular collogical or pathological state, and so allowing the detection of tissue specific tissue under a specific pathological condition; to detect or pathology-specific pathological condition; to detect condition; to detect developmental specific genes; and to detect RNA transcripts and splice variants of a transcriptome of a patient suffering from a particular collogoner. ABN27253 to ABN59589 represent oligonucleotide sequences from cracs, humans and mice, which are used in the exemplification of the printed specification, but was obtained in electronic format collogonal action, the printed specification, but was obtained in all or premate and so

The present invention describes oligonucleotide libraries for detecting messenger RNAs that populate a (sub-)transcribtome, where the (sub-)transcriptome comprises messenger RNAs transcribed from multiple transcription units that populate a genome. The library comprises several circulation units that populate a genome. The library comprises several coligonucleotides, each capable of hybridising selectively to a set of messenger RNAs transcribed from a given transcription unit of the genome, which encodes one or more messenger RNA splice variants. The coligonucleotide libraries are useful for detecting mRNAs from a biological sample, in expression profiling studies, in qualitatively or quantitatively characterising the corresponding transcriptom, and in detecting RNA transcripts and splice variants of human or animal contraints to detect transcripte and splice variants of human or animal colibraries to detect transcripte of a sub-transcriptom under a particular biological or pathological state, and so allowing the detection of tissue can pathology-specific genes such as those genes only expressed in the pathology-specific genes such as those genes only expressed in correspondental specific genes; and to detect RNA transcriptom of a transcriptome of a patient suffering from a particular clasuate and specific pathology-specific genes; and to detect RNA transcripts and splice variants of a transcriptome of a patient suffering from a particular content of a transcriptome of a patient suffering from a particular content of a transcriptome of a persent oligonucleotide sequences from human and splice when the such as those genes and splice of the suffering from a particular content of the such was the such as those sense and splice of the such as t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     rats, humans and mice, which are used in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

inhibition of expression of a target gene, where (1) comprises double granded RNA of 15-40 nucleotides in length and a 3 or 5 overhang having a length of ornacleotide to 5-nucleotides on each strand, where the baying a length of ornacleotide to 5-nucleotides on each strand, where the sequence of the double stranded RNA is substantially identical to a portion of a mRNA or transcript of the target gene. Also described: (1) interfering with or inhibiting the expression of a target gene in a cell by exposing the cell to an amount of (1); (2) a gene silencing array comprising a substantially flat substrate, and addressably arrayed different double-stranded RNAs; (3) an array-based method of assessing a different double-stranded RNAs; (3) an array-based method of assessing a validating a gene as a potential drug target for a disease or condition; (5) selecting an optimised sequence of a double-stranded RNA for interference with or inhibition of expression of a target gene in a cell; and (6) a short double-stranded RNA effective for interfering with or inhibiting expression of a target gene comprising any of 311 20-78 nucleotide sequences (see ADC16276 to ADC16586). (1) has cytostatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     activity, and can be used in gene therapy. The RNAs are useful as reverse genetic and/or therapeutic tools for interfering or inhibiting expression of a target gene. They are useful for thereforms
genetic and/or therapeutic tools for interfering or inhibiting expression of a target gene.
                                                                                                                                                                                   present invention describes an RNA (I) used for the interference or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ଚ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         anchoring region for transmembrane or membrane anchoring regions that are anchoring region for transmembrane or membrane-anchoring regions that are not naturally part of the protein. The relative response of membrane associated proteins to cell surface-associated antigen versus antigen in solution, and the sensitivity of intracellular signaling mediated by membrane-associated proteins can be altered. They can be important in treatment of, e.g. HIV infection, bacterial infections, parasitic infections, inflammatory/autoimmune disorders (e.g. rheumatoid arthritis, osteoarthritis or inflammatory bowel disease), cancer, allergic/atopic diseases (e.g. asthma or eczema), congenital disorders (e.g. cystic fibrosis or sickle cell ansemia), dermatological disorders (e.g. psoriasis), neurological disorders (e.g. multiple sclerosis), organ transplant rejection, graft-versus-host diseases, or metabolic/diopathic diseases (e.g. diabetes)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1444 GAGCGCCAGGAGCAGGAGGCCAAGCGGCAGCTGGAGAAGCAGCTGGAAAGCAG 1503

The properties and level of expression of a membrane-associated procein may be altered by substituting a transmembrane region or a membrane-anchoring region for transmembrane region or a membrane not naturally part of the protein. The relative response of membrane-associated proteins to cell surface-associated antigen versus antigen in solution, and the sensitivity of intracellular signaling mediated by membrane-associated proteins can be altered. They can be important in treatment of, e.g. HIV infection, bacterial infections, parasitic infections, inflammatory/autoimmune disorders (e.g. rheumatoid arthritis, osteoarthritis or inflammatory bowel disease), cancer, allergic/atopic diseases (e.g. esthma or eczema), congenital disorders (e.g. cystic fibrosis or sickle cell anaemia), dermatological disorders (e.g. cystic psoriasis), neurological disorders (e.g. multiple sclerosis), organ transplant rejection, graft-versus-host diseases, or metabolic/idiopathic diseases (e.g. diabetes)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1444 GAGCGCCAGGAGCAGGAGGCCAAGCGGCAGCTGGAGCTGGAGAAGCAGCTGGAGAAGCAG 1503

The invention relates to detecting (M1) alterations in trinucleotide repeat (TMR) tract lengths comprising: (i) contacting mammalian cells with a shuttle vector (containing approximately 25 repeats) that enters and replicates in the cells; (ii) recovering the replicated shuttle vector from the cells; (iii) introducing the vector into a yeast cell in the presence of a selection agent or (where the expanded TMR confers a confers resistance to the selective agent or His+ phenotype; and (iv) confers resistance to the selective agent or His+ phenotype; and (iv) celecting yeast cells with the shuttle vector containing TMR tract contextions that survived the presence of the selective agent. Also included is an adaptation of the used to detect the contraction of 33 or concern to the present invention are useful for identifying disorders with genetic alterations associated with TMR instability such as cancer espinance rebellar and prostate), Fragile X syndrome, Huntingron's disease, myotonic dystrophy, spinal and bulbar muscular atrophy (SBMA), contactorubaral-palidoluysian atrophy (DRPLA), Friedratch's ataxia and Kennedy's disease. The present sequence is the CAG25 TMR known containing the method of the present sequence is the CAG25 TMR known containing the invantion.

```

anchoring region for transmembrane or membrane anchoring regions that are anchoring region for transmembrane or membrane anchoring regions that are not naturally part of the protein. The relative response of membrane associated proteins to cell surface-associated antigen versus antigen in solution, and the sensitivity of intracellular signaling mediated by membrane-associated proteins can be altered. They can be important in treatment of, e.g. HIV infection, bacterial infections, parasitic infections, inflammatory/autoimmune disorders (e.g. rheumatoid arthritis, osteoarthritis or inflammatory bowel disease, cancer, allergic/atopic diseases (e.g. asthma or eczema), congenital disorders (e.g. cystic fibrosis or sickle cell anaemia), dermatological disorders (e.g. cystic psoriasis), neurological disorders (e.g. multiple solerosis), organ transplant rejection, graft-versus-host diseases, or metabolic/idiopathic diseases (e.g. diabetes)

sequence was used in the construction of chimeric receptors

Example 2; Fig 3; 47pp; English

Altering the properties or level of expression of membrane-associated proteins, e.g., to change responses to cell surface antigens or the sensitivity of intracellular signaling.

The invention describes a method of determining open reading frames in the genome of organism, comprising contacting mRNA from cell of organism with a single oligonucleotide primer (I) at low stringency, preparing cingle-stranded cDNA by reverse transcribing mRNA with (I), amplifying cond amplifying repse with different primers and sequencing resulting nucleic acids. The method is useful for: determining that a known nucleotide sequence from a genome of an organism corresponds to a nucleotide sequence from a genome of an organism corresponds to a nucleic acid molecule from a genome of an organism; and for sequencing nucleic acid molecule from a genome of an organism; and for sequencing all or part of agenome of an organism; and for sequencing all or part of agenome of an organism mRNA is obtained from mammalian or human cell which is associated with a pathological condition e.g. a colon cancer or bereat cancer cell. The method is useful for analyses of oppulations of subjects and can be used to carry out genetic analyses of large or small populations. further, it can be used to study living an individual or population more or less likely to be afflicted with ciseness such as cancer, to determine antibiotic resistance or nontolect congenital diseases, and the risk of affliction to a foetus, as well as through ove or sperm. The analyses for pathological conditions can be through ove or sperm. The analyses for pathological conditions can be thurbush over sperm. The analyses for pathological conditions can be thus the area of agriculture, for example the genomes of food crops can be thus and the risk of action or present, defects in plant of a plant or determine if resistance can be strided to determine if are example or spenus. Genome can be strided to determine if area can be seed to defermine the cancer or non-particular and the strand of administ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1454 AGCAGGAGGCCAAGCGGCAGCTGGAGCTGGAGAAGCAGCTGGAGAAGCAGCGGGAGCTGG 1513

Similarly, the method permits determination of the pathogens which integrate into the genome, such as retroviruses and other integrating viruses such as influenza virus, have undergone shifts or mutations, which may require different approaches to therapy. This method is also applied to eukaryotic pathogens, such as trypanosomes, different types of Plasmodium, etc. The method essentially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           37

                                                                                                                                                                                                                                                                                                                                                                                                         Diagnosing spinocerebellar ataxis type II - by PCR and determining number of CAG repeat units.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents a fragment of the SCA2 gene. It can be used in the method of the invention for diagnosing spinocerebellar ataxis type II, by performing PCR on the test DNA using two primers hybridising to parts of the SCA2 gene sequence, and determining the number of CAG repeats in the amplified products. The method provides an easy means for the diagnosis of spinocerebellar ataxis type II
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SCA2 gene; spinocerebellar ataxis type II; CAG repeat; PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence represents a fragment of a human CAG repeat containing clone DNA sequence isolated using the method of the invention. The method is for analyzhing nucleic acids in a sample, and comprises: (a) providing a sample containing nucleic acid, a first oligonucleotide primer comprising a CTG repeat, a second oligonucleotide primer comprising a CTG repeat and a polymerase and PCR reagants; (b) preparing the nucleic acid so that it is amplifiable; (c) amplifying the nucleic acid so that it is amplifiable; (c) amplifying the nucleic acid with the first and second primers; and (d) detecting the amplified product. The method is used to distinguish between the expression of genes in two or more biological samples, e.g. body fluids, cells, solid tissue or solid and liquid foods. It can be used in medical diagnostics, e.g. to differentiate between normal and diseased tissue or to assess the variation within monozygotic twin pairs. The method allows the isolation and analysis of genome subsets containing CAG repeats which are known to be important in a number of neurological diseases including Huntington's chorace. The method uses PCR suppression, in which only fragments which contain a target repeat are efficiently amplified. This allows accurate identification of differentially expressed genes in various cell types.

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed
and is derived by analysis of the total score distribution.

```
0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymuclectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732114|gb|AR12972.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent B. coli X110-GG1d (Stratagene) cells and selected for ampicillin resistance."

                                                                        ò
                                                                                                                                                                        ò
                                     (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwadv2 (gel #742114|gb|AR12972.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XII.0-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AV533640 Arabidopsis thaliana flower buds Columbia Arabidopsis thaliana cDNA clone FB065d08F 3', mRNA sequence.

/note="vector: PWD42nv; Purified genomic DNA from M.
musculus C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resources
/nttp://www.jax.org/resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
vas blunt end-repaired with T4 DNA polymerase and T4
polymuclectide kinase. Adaptor oligonuclectides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pWD42 (gil 4712114)gb]AP129072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coli XL10-Gold (Stratagene) cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   B

The DNA was hydrodynamically sheared by repeated passage through a 0.05 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWM2 (gi[472114] plat29072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated

/note="Vector: PWD42nv; Purified genomic DNA from M.
musculus C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resources/documents/dnares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polynucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli Xil0-Gold (Stratagene) cells and selected for ampicillin resistance."

electrophoresis. Vector DNA was prepared from a derivative electrophoresis. Vector DNA was prepared from a derivative of pND42 [gi|4732114[gb|AR129072.1], a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into adaptorent B. coli X110-Gold (Stratagene) cells and selected for ampicillin resistance."

TITLE

COMMENT

```
was blunt end-repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gal electrophoresis. Vector DNA was prepared from a derivative of pMNA2 (gql 4732114[gb]AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1470 GCAGCTGGAGCTGGAGAAGCAGCTGGAGCAGCGGGAGCTGGAGCGGCAGCGAGAGA 1529

'RescueMu.' Grid G was grown at Stanford in 2000. DNA was extracted from leaf punches, double digested using BamHI and B9111, and ligated to form circular plasmids. DH10B cells were transformed and then screened on LB plates with

/note="Organ: leaf, Vector: RescueMu (engineered from pBlueScript backbone); Site 1: BamHi, Site 2: BgLII;
RescueMu is a 4.9 kb, modified maize Mu transposon
designed to allow plasmid rescue from total genomic DNA.
Mu elements insert preferentially into transcription
units. For more information on RescueMu, go to the web
site 'www.zmdb.iastate.edu' and follow the links for
'RescueMu.' Grid G was grown at Stanford in 2000. DNA was
extracted from leaf punches, double digested using BamHI
and BglII, and ligated to form circular plasmids. DHIOB
cells were transformed and then screened on LB plates with

Sequence 12, Application US/09043303

Patent No. 6251589

GENERAL INFORMATION:
APPLICANT: TSUJI, Shoji

TITLE OF INVENTION: Method for Diagnosing Spinocerebellar Alaxia Type 2 and
TITLE OF INVENTION: Piteners Therefor
FILE REFERENCE: 0760-0341P

CURRENT APPLICATION NUMBER: US/09/043,303
CURRENT PILING DATE: 1998-05-18

EARLIER APPLICATION NUMBER: PCT/JP96/01999

EARLIER PILING DATE: 1996-07-18

NUMBER OF SEQ ID NOS: 17

SEQ ID NO 12

LENGTH: 78
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            1450 CAGGAGCAGGAGGCCAAGCGGCAGCTGGAGCTGGAAGCAGCTGGAGAAGCAGCAGCAGGGAGA 1509
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     9

                                                                                                                                                                                                                                                                                                              Sequence 4823, Application US/09270767

Patent No. 6703491

GENERAL INFORMATION:
APPLICANT: Homburset al.
TITLE OF INVENTION: Wileic acids and proteins of Drosophila melanogaster
FILE REFERENCE: File Reference: 7326-094

CURRENT APPLICATION NUMBER: US/09/270,767

CURRENT FILING DATE: 1999-03-17

NUMBER OF SEQ ID NOS: 62517

SOFTWARE: Patentin Ver. 2.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          GENERAL INFORMATION:
